Q: How to determine that an object was destroyed and the container is no longer managing it? I am very new to Objective-C, and want to ask how I should be able to determine if the container is no longer managing a specific object? Here is an example: self.vehicleManager = [[VehicleManager alloc] init]; Vehicle *testVehicle = [[Vehicle alloc] init]; [self.vehicleManager getVehicleWithID:testVehicle.vehicleID]; self.vehicleManager is the object which manages the vehicle object (from what I understand). I want to do something if the container no longer manages the vehicle object, as if the user stops using the app. I need to send an email to the user with a specific message if this happens, but how do I know if the container no longer manages this vehicle object? A: First thing you need to do is notify your manager that the object was deallocated. Then, your manager can examine the object and decide what to do next. As for your question, you can detect when an object is deallocated by implementing -dealloc. Here's how: In your.h file, include: - (void)dealloc; Implement that method: - (void)dealloc { [vehicleID release]; [vehicle release]; [manager release]; [super dealloc]; } If you only want to send an email when your object is deallocated, just add the dealloc method to a timer. When your object is deallocated, the timer will send your email. If you want to be notified when your object is no longer being managed, use KVO. The object being deallocated will send an -awakeFromNib message to notify any KVO observers that it has been deallocated. Q: C#/WPF - LayoutControls doesn't work with ListBox I am trying to do a ListBox with layout controls. But i get this error: "The attached list object does not support layout controls." Here is the code:
